The Speak Logic Project Launched

The Speak Logic Project is to promote better communication by promoting the learning and the understanding of the principle of communication.

Tucson, Arizona June 2, 2011 Today Volvick Derosé announced the launch of The Speak Logic Project. The Speak Logic Project is a nonprofit organization that will promote better communication by helping people with the learning and the understanding of the principle of communication. Since communication is common among all of us, our applications always depend on our communications. By communicating better, it helps us with the execution and the outcome of our applications.

Given that our applications execute as a result of our communications, any mistake that we make in our communications is likely to cause problems in our applications; if we can communicate without error, then that will provide us with a pathway to produce an error free application. In order to promote better communication, the communication that is common among all of us must be understood. The Speak Logic Project is launched to help people communicate better by helping the understanding of the communication interface that connects all of us and the usage of that communication interface to execute our applications.

To help promote better communication, The Speak Logic Project provides books to help with the learning and the understanding of the principle, books to help with the modeling of applications, and also book to help with the analysis of communications. Those books are: Understanding The Principle of Communication, Identification and Correction of Error in Communication, Application Modeling Tutorial Communication Domain, Project Modeling Tutorial Communication Domain, and the Communication Analysis Guideline. In addition to books to help with the leaning and the understanding of the principle of communication, The Speak Logic Project also provides software to help with the analysis of communication and information. Currently, The Speak Logic Project has 4 different types of software in its portfolio to help users with the analysis of information and communication. The software includes Speak Logic Information Analysis for Microsoft Office, Speak Logic Information Analysis for Internet Explorer, Speak Logic Information Analysis Desktop and Speak Logic Information Analysis for Visual Studio.

The communication that is common between all of us provides us the ability to execute our applications. By learning and understanding the principle of communication, that helps with the modeling of applications that are driven by communications. By using the software provided by The Speak Logic Project to analyze communications and information, it provides a pathway to an error free communication where that communication can produce an error free application.
